QUESTION 1	Team Room for Players > Coding
⚠️ Needs Review	QUESTION DESCRIPTION In this challenge, determine the minimum number of chairs needed to accommodate all cricket players in a new team relaxation room. The room does not have any chairs at the beginning. There will be a string of simulations. A combination of four characters describes each simulation: C, R, U, and L
Score 40	

- C - A new player arrives in the room. If there is a chair available, the player takes it. Otherwise, a new one is purchased.
- R - A player goes to play cricket, freeing up a chair.
- U - A player arrives at the room after playing. If there is a chair available, the player takes it. Otherwise, a new one is purchased.
- L - A player leaves the room for practice, freeing up a chair.

Example:

Given a string representing the simulations: "CRUL". In this case, the simulation is represented in the below table:

Action	Total	Available
-	0	0
C	1	0
R	1	1
U	1	0
L	1	1

Read the string as input from the console and print the minimum number of chairs required for the simulation.

CANDIDATE ANSWER

Language used: **Python 3**

```

1
2 simulations = input()
3
4 total_chairs = 0
5 available_chairs = 0
6
7 for action in simulations:
8     if action in ['C', 'U']:
9         if available_chairs > 0:
10             available_chairs -= 1
11         else:
12             total_chairs += 1
13     elif action in ['R', 'L']:
14         available_chairs += 1
15
16 print(total_chairs)
17

```

QUESTION 2

Correct Answer

Score 50

Programming Q2.1 > Coding

QUESTION DESCRIPTION

Given an integer array `nums`, return `true` if any value appears **at least twice** in the array, and return `false` if every element is distinct.

Example 1:

Input: 1,2,3,1
Output: true

Example 2:

Input: 1,2,3,4
Output: false

Example 3:

Input: 1,1,1,3,3,4,3,2,4,2
Output: true

Constraints:

- `1 <= nums.length <= 105`
- `-109 <= nums[i] <= 109`

CANDIDATE ANSWER

Language used: **Python 3**

```

1
2 numbers = list(map(int, input().split(",")))
3
4 num_set = set(numbers)
5
6 if(len(numbers)==len(num_set)):
7     print("false")
8 else:
9     print("true")

```

QUESTION 3

Correct Answer

Score 50

Programming Q2.2 > Coding

QUESTION DESCRIPTION

Given two strings `s` and `t`, return `true` if `t` is an anagram of `s`, and `false` otherwise.

An **Anagram** is a word or phrase formed by rearranging the letters of a different word or phrase, typically using all the original letters exactly once.

Example 1:

Input:

```
anagram
nagaram
```

Output: `true`

Example 2:

Input:

```
rat
car
```

Output: `false`

Constraints:

- `1 <= s.length, t.length <= 5 * 104`
- `s` and `t` consist of lowercase English letters.

CANDIDATE ANSWER

Language used: **Python 3**

```
1
2 s = input()
3
4 t = input()
5
6 if(sorted(s) == sorted(t)):
7     print("true")
8 else:
9     print("false")
```

QUESTION 4

Correct Answer

Score 50

Programming Q2.3 > Coding Java

QUESTION DESCRIPTION

Write a program to find the count of odd numbers from a given integer array.

The program will take the following as inputs :

-> length of an integer array, n

-> n number of elements

If the total number of odd numbers is 4 in an integer array, then you need to print "Odd Elements: 4" without quotes.

If there are no odd numbers within the integer array or the array is empty then print "No odd elements are present" without quotes.

For example,

Length of an integer array: 6

Elements are: 3, 5, 7, 10, 12, 15

So the output will be, "**Odd Elements: 4**".

Similarly for the case where no odd elements were found within the integer array.

Length of an integer array: 4

Elements are: 10, 12, 50, 64

So output will be, "**No odd elements are present**".

Note:

You can use/refer to the below given sample input and output to verify your solution.

Sample Input1:

6
3
5
7
10
12
15

Sample Output1:

Odd Elements: 4

Sample Input2:

4
10
12
50
64

Sample Output2:

No odd elements are present

CANDIDATE ANSWER

Language used: **Python 3**

```
1 # Enter your code here. Read input from STDIN. Print output to STDOUT
2
3 n = int(input())
4 count = 0
5
6 for i in range(n):
7     number = int(input())
8     if(number%2==1):
9         count+=1
10
11 if(count==0):
12     print("No odd elements are present")
13 else:
14     print("Odd Elements:",count)
```

QUESTION 5

Needs Review

Score 50

Programming Q2.8 > Coding

QUESTION DESCRIPTION

Given a sorted (in ascending order) integer array `nums` of `n` elements and a target value, find if there exists any pair of elements (`nums[i]`, `nums[j]`, `i!=j`) such that their sum is equal to target.

Constraints:

`1 < nums.length <100`

Sample Input 1:

```
-3, -1, 0, 1, 2
-2
```

Sample Output 1:

```
Yes
```

Sample Input 2:

-2, 0, 1, 1, 5
0

Sample Output 2:

No

CANDIDATE ANSWER

Language used: **Python 3**

```
1
2 nums = list(map(int, input().split(",")))
3 target = int(input())
4 success = False
5
6 left = 0
7 right = len(nums) - 1
8
9 # Two-pointer approach
10 while left < right:
11     current_sum = nums[left] + nums[right]
12
13     if current_sum == target:
14         success = True
15         break
16     elif current_sum < target:
17         left += 1
18     else:
19         right -= 1
20
21
22 if (success==True):
23     print("Yes")
24 else:
25     print("No")
26
```
